6. Key capabilities
7. Design principles that run through the product
8. Current state and next steps

1. The product in one page

Aj Smart Biz gives a small or mid-sized business a complete online presence and a back office in one subscription: a branded public website on its own domain, a product and service catalogue, a cart and order desk, appointment booking, stock control, counter invoicing, customer accounts, enquiry inboxes and visitor analytics. Every business (a *tenant* or *company*) runs on one shared platform. The platform operator sells plans, provisions companies and controls which features each plan includes.

5
applications in one repository: API, two admin consoles, product website, tenant website themes

52
database tables covering tenants, website content, catalogue, orders, stock, invoices, billing and leads

19
sellable features (functionalities) that a plan can grant and a tenant can switch on

> **The single idea behind the platform**
>
> One deployment per website design serves *every* company that uses it. The website reads the domain it was opened on, asks the API which company owns that domain, and brands itself from the answer. Nothing is built per tenant, so onboarding a new business is a database operation and takes minutes, not a project.

2. Problem and opportunity

The problem

- Small businesses (salons, decor and framing studios, retailers, service providers) need a website, a way to take orders and bookings, and simple stock and billing — but buy each from a different vendor, or not at all.
- Agency-built websites are expensive, go stale, and cannot take an order or a booking.
- Generic site builders do not know about branches, GST invoices, WhatsApp-first ordering, or Indian payment habits (UPI, cash on delivery).

The opportunity

- One subscription that bundles **website + catalogue + orders + bookings + stock + billing + leads**, sized by plan.
- WhatsApp-first: orders and enquiries can be handed to the business's WhatsApp, which is how its customers already talk to it.
- Recurring revenue (monthly to yearly plans), with upsell built in: tenants browse higher plans and request an upgrade from inside their console.

3. Who uses it

Persona	Where they work	What they need
Platform owner / Super admin	Super Admin console (:4200)	Sell plans, onboard companies, track income and renewals, approve upgrade requests, run the marketing website.
Platform staff	Super Admin console (role `staff`)	Day-to-day tenant support; cannot touch the protected root account.
Company main admin	Company Admin workspace (:4300)	Edit the website, manage branches, roles and staff, view the plan; bypasses all permission checks.
Company staff	Company Admin workspace	Work the order queue, bookings, stock, invoices and leads — only the menus their role allows.
Website visitor / customer	Tenant website (themes)	Browse products and services, place an order, book a slot, sign in with phone + OTP, see order history.
Prospect	Product website (:4700)	Understand what is sold, compare plans, see template demos, book a demo.

4. Product suite

Application	Technology	Port	Purpose
Aj-Smart-Biz-Backend	Node.js · Express · Sequelize · MySQL	4000	The only API. Serves every other application.
Aj-Smart-Biz-Supper-Admin	Angular 22	4200	Platform console — companies, plans, subscriptions, masters, marketing site CMS.
Aj-Smart-Biz-Admin	Angular 22	4300	Company workspace — website content, orders, stock, invoices, customers, leads, roles.
themes/default · midnight · atelier	Next.js 15	4400 · 4500 · 4600	Tenant public websites; three visual designs over identical logic.
Aj-Smart-Biz-Technology	Next.js 15	4700	The product (marketing) website that sells the platform.

5. Business model

Plans and subscriptions

Revenue comes from **plans** sold to companies as dated **subscriptions**. A plan defines:

- **Price** (with optional discount price), currency and **billing cycle** — monthly, quarterly, half-yearly, yearly or lifetime — plus optional trial days.
- **Quotas** — maximum branches, maximum admins, included users and storage (MB).
- **Functionalities** — which sellable features the plan grants (see section 6).
- **Visibility** — shown on the public pricing page (`isPublic`), offered to tenants for self-requested upgrades (`showInAdmin`), marked "popular".

Actual price points are configured by the platform owner in Plan Management and are not fixed in code.

Revenue levers built into the product

Upgrade requests

Tenants see every requestable plan labelled *Upgrade* or *Downgrade* and ask for it in one click. The request lands at the top of the platform's renewal desk.

Fair proration

Mid-term changes credit unused days by daily value: `credit = term total × remaining days ÷ term days`, so monthly and yearly plans compare fairly.

Pre-renewal & auto-renew

The next term can be booked before the current one ends; auto-renew rolls terms over automatically.

Feature-based tiers

Website sections, cart, stock, invoices and customer accounts are separate grants, so plans can be tiered by value delivered.

What happens when a plan lapses

Expired, suspended or missing plans block creating branches and admins, hide paid menus, and replace the public website with a polite *holding page* (still branded, `noindex`, never mentioning price). This gives a strong, fair reason to renew without destroying the tenant's data — nothing is ever deleted.

6. Key capabilities

Area	Capability
Website	Hero slider (desktop + mobile art), About page with self-counting figures, Team, Gallery, Contact page, Features/Benefits, Testimonials (curated or visitor-submitted with moderation), Blog, Social links, Share button, typed WhatsApp numbers, menu built by the API.
Branding	Own domain(s), branch sub-domains with their own logo and content, theme colours per company or branch, three website designs.
Catalogue	Three-level product category tree, up to 8 photos per product, price / offer price / free-text price label, specs, offers page, stock status.
Orders	Cart or single "Order now", order to WhatsApp or to UPI/payment link, order queue with six forward-only states, separate payment status, sales analytics.

Area	Capability
Services & bookings	Service categories and cards, enquiry form (WhatsApp and/or inbox), slot booking with capacity, Service Leads inbox, booking diary, revenue.
Stock	Multiple warehouses, append-only stock ledger, reservations on confirm, issue on dispatch, transfers, low/out-of-stock views, retail and cost valuation.
Invoicing (POS)	Counter billing with line and bill discounts, GST tax presets, round-off, draft → issued → cancelled, partial payments, stock deduction, analysis by product/admin/payment mode/branch.
Customers	Phone + OTP sign-in on the website, saved addresses, order and booking history, customer list in the console.
Leads & analytics	Device-level visitor tracking with UTM, sessions, stages; campaign analysis for the marketing site.
Access	Roles × menus × five actions (view/create/edit/delete/export), main admin bypass, plan-driven menus.
Operator tools	Company provisioning in one form, duplicate a company's set-up, AI content creator (Claude) that drafts a new tenant's website copy, sample companies.

7. Design principles that run through the product

1. **Nothing is deleted.** Almost every table uses soft delete; deleting a company soft-deletes its branches, roles and admins together, and restore brings them all back.
2. **History is frozen.** A subscription snapshots the plan; an order line snapshots the product and price; an order copies the address as text. Editing the source later never rewrites the past.
3. **One answer, many screens.** Entitlement, quota, offer status and enquiry routing are each decided by one function, and every screen renders that answer — so a disabled button and a refused request never disagree.
4. **Absent, not empty.** A website section with no content or no entitlement is not rendered at all — no empty boxes, no invented copy.
5. **Prices come from the server.** The public cart sends product ids and quantities only; every price is taken from the catalogue at order time.
6. **API-first.** All content the websites show comes from the API; templates hold no business data.

8. Current state and next steps

Built and verified

- All five applications build cleanly (dev and production).
- 188 end-to-end API checks and 63 browser checks recorded in the project README.
- Docker images and CI/CD to a self-hosted server with nginx and TLS.

Known gaps (see Document 11)

- No SMS gateway yet — OTP uses a development code.
- No online payment gateway; payment is UPI/link hand-off.
- No automated test suite in the repositories.
- `maxUsers` and some quotas are displayed but not metered.
- Refresh tokens are issued but not used by the consoles.
