AJ SMART BIZ · DOCUMENT 11

QA Strategy, Known Issues & Roadmap

How the platform is verified, what is out of date or incomplete today, and what to build next.

Audience	Product owner, QA, tech lead
Version / date	1.0 · 7 November 2026

Contents

1. Current verification
2. Test strategy (recommended)
3. Critical test scenarios
4. Known issues and documentation drift
5. Functional gaps
6. Roadmap

1. Current verification

- The project README records **188 API checks over five passes** (both logins, provisioning, quotas, permission matrix, soft-delete cascade and restore, dashboards, uploads, ICO validation, domain resolution, guard rails, cross-tenant isolation) and **63 browser checks** against production bundles of both consoles.
- These suites were run from a scratch directory (SQLite + puppeteer-core) and are **not committed** to the repository.
- No unit tests exist in any application; Angular schematics are configured with `skipTests`; there is no linter configuration.

> **Risk**
>
> Without committed tests, regressions in business rules (proration, stock, entitlement) are caught only manually.

2. Test strategy (recommended)

Level	Tooling	Focus
Unit — backend services	node:test or Jest, SQLite in-memory	subscription transitions and proration, quota reasons, entitlement, order/stock side effects, invoice maths, booking slots, phone normalisation.
API integration	supertest against `app.js` on SQLite	Guards per module, permission matrix, tenant isolation (foreign id → 404), validation envelopes.
Console E2E	Playwright	Sign-in flows, forced password change, create company, plan change dialog, order workflow.
Website E2E	Playwright with `?domain=`	Holding page, absent sections, cart → order, OTP sign-in, booking.
CI	GitHub Actions on pull requests	Run all of the above + `ng build` + `next build` before the deploy branches.

3. Critical test scenarios

#	Scenario	Expected
T1	Admin of company A requests company B's branch id	404

#	Scenario	Expected
T2	Create admin when quota used / plan expired / no plan	400 with reason limit_reached / expired / no_plan
T3	Upgrade mid-term	Old term superseded; credit = total × remaining ÷ term days; event + transaction written
T4	Sweeper on a term past end + grace	Expired (or renewed if autoRenew); website shows holding page
T5	Edit plan quotas during a running term	Running term unchanged (snapshot)
T6	Order body includes a price	Ignored; catalogue price used
T7	Confirm order with insufficient stock	Refused; order remains pending; no ledger change
T8	Dispatch then cancel	Stock returned via ledger movement
T9	Move order backward	Refused
T10	Feature granted but not enabled	`features.x = null` in public payload; console write still allowed
T11	Feature live with no content	Section absent; console says “Nothing published yet”
T12	Category moved under its own descendant / to level 4	Refused
T13	Unknown domain on /theme/company-details	`resolved:false`, no error
T14	Role without view on a menu	Menu absent from /auth/me, route guard redirects, API 403
T15	Issue invoice then cancel	Stock deducted then returned; totals and round-off correct

4. Known issues and documentation drift

#	Area	Issue	Suggested fix
K1	Deployment	Angular production `environment.ts` uses `aj-smart-biz-api.ajtechhub.com`; nginx vhost is `smart-biz-api.ajtechhub.com`.	Align; or use relative `/api/v1` and let the image's nginx proxy it (as its template intends).
K2	Repo state	All `.github/workflows/*` and `deploy/*/.env` are deleted (uncommitted) in the working tree.	Confirm intent before committing.
K3	Backend README	Says `/website/branding` and `/website/company-details` — code uses `/theme/…`; says `/dashboard/super-admin` — code is `/super-admin/dashboard`; “14 models” — there are 52; stale upload folder list.	Update README.

#	Area	Issue	Suggested fix
K4	schema.dbml	39 tables; missing company_features, company_invoices, company_invoice_items, company_social_links, company_testimonials, leads, lead_visits and six marketing tables.	Regenerate (Document 05 is current).
K5	Theme READMEs	Wrong endpoint prefix (`/public` or `/website`); describe an uploads rewrite and `BACKEND_ORIGIN` that the code does not use; wrong domain-resolution order.	Update READMEs.
K6	Console READMEs	Module tables outdated; Admin README says branding is `/public/branding` (code: `/theme/branding`).	Update READMEs.
K7	Technology README	Describes the old “aurora glass” look and says only /demo is dynamic (layout is force-dynamic).	Update README.
K8	Backend	`routes/order.routes.js` is imported but never mounted (orders are declared inline in `myCompany.routes.js`).	Remove or mount.
K9	Admin console	Two classes named `OrdersManagerComponent` (settings vs queue).	Rename settings one, e.g. `OrderSettingsComponent` .
K10	Admin console	`AccessService` mixes `/admin/roles` and `/roles` prefixes.	Use one prefix.
K11	Admin console	Seeded menu icons are names (`grid`) but the shell only uses icons ≤ 3 chars, so emoji fallbacks are always used.	Map names to icons or seed emoji.
K12	Auth	Refresh token stored but never used; sessions end at access-token expiry.	Implement refresh in the interceptor.
K13	Backend	`resolveCompanyId` is copy-pasted in ~10 controllers.	Move to `utils/` .
K14	Workflows	Stale comments (“calls no API”, “nginx listens on 80” in Next.js workflows).	Clean up.

5. Functional gaps

Gap	Impact
No SMS gateway (OTP dev code)	Customer accounts are not production-safe.
No payment gateway	Platform payments recorded manually; tenant orders hand off to UPI/link without confirmation callback.
No email/notification service	No order, booking, renewal or expiry emails.

Gap	Impact
`maxUsers` not metered	Displayed on My Plan as included amount only.
No data export / erasure tooling	Export permission exists in RBAC; privacy requests handled manually.
AI jobs in memory	A restart loses running AI content jobs.
No migrations	Alter-sync is risky for destructive schema changes in production.

6. Roadmap

Now (stabilise)

- Fix K1–K2 and README drift
- Commit API + E2E suites; CI on PRs
- SMS gateway behind `hasSmsGateway()`
- Backups and restore drill

Next (monetise)

- Payment gateway for platform invoices and tenant orders (webhook → paid)
- Email/WhatsApp notifications for renewals and orders
- Self-serve sign-up from the product site
- Refresh tokens

Later (scale)

- Sequelize migrations
- Object storage/CDN for uploads
- More website designs per business type
- Data export & privacy tooling
- Persistent job queue for AI and reports
